

time to put  
your roof  
to work

solar heating and solar pv systems  
that work well and look great

## Benefits

- Take control of your energy bills
- Reduce your carbon footprint
- Choose a greener lifestyle
- Invest in your home with great looking solar panels

There are many good reasons why people choose to install solar energy on their home. Whatever your goals, Clearline solar systems from Viridian are the ideal choice. Designed to install neatly and simply within the roof covering, their looks cannot be beaten, especially if you are interested in installing both solar electric and solar heating panels together.

Our focus on simplicity and durability ensures that you are installing a system that will give many, many years of trouble-free operation.

### Fantastic Looking Solar Installations

With Viridian Solar you can install solar and still maintain the good looks of your property. Slimline and elegant, Clearline solar panels replace tiles or slates on a pitched roof for a cleaner, simpler installation.

Panels are available in three sizes, and can be installed together or spaced apart to allow you to choose the positioning that best complements your roof.

### Both Solar Technologies in a Matching Package

There are two types of solar panel available - solar thermal panels heat water for baths and showers, solar pv panels make electricity. Viridian Solar offers both technologies with matching panels that are easily installed together on the roof to create a harmonious look for your home.

### Peace of Mind

Like Clearline, most panels achieve the European standards for performance as a solar product, but in addition Clearline solar panels have been properly tested as a building material. The weathertightness, wind resistance and fire performance have all been approved by the leading UK test authority and awarded a BBA Agreement certificate.

### Simple to Use, Simple to Maintain

Solar energy is extremely popular because it is so trouble-free and requires no significant changes to your lifestyle. Solar heating systems need infrequent routine maintenance. Clearline systems are available in a simple drainback format which needs no specialist equipment and is so easy that many users are able to look after their own routine maintenance.

## Carbon Savings

Each year, a solar heating system or a 1kWp PV installation produces savings equivalent to:

- taking a car off the road for 3 months
- flying between London and Paris 6 times

## Solar Optimised Cylinders

The Symphony range of hot water cylinders maximises the performance of your solar heating system.

Made from stainless steel with a 20 year guarantee, hot water is delivered at mains pressure to the outlets for fast bath filling and powerful showers.

## The Pod

The Pod makes solar water heating simple. It's sized to fit through a standard loft hatch and preheats the water to your existing hot water system using either solar thermal or solar pv panels.

Leave your existing hot water cylinder or combi-boiler in place and quickly integrate solar hot water with minimum disruption.

## How it Works

Both technologies produce most energy when the panels face due south, but installations facing between east and west are also effective.

Solar heating gives the biggest savings for households with higher hot water usage. Solar PV saves most if your home has electricity use during daylight hours.

Of course, now you can choose to have both together.
